

UTrucking AI — Executive Brief

One page. What's live, what's next, and the biggest levers. Every number is from our own data.

Where it stands

A **live AI phone assistant** plus a **data-backed plan** to automate the front desk and tighten the back office. Built, tested, and deployed.

Live today

- **Answers the phone** — looks up any student's order, verifies who they are, and transfers to the team. Deflects the repetitive calls.
- **Quotes prices on the call** — *"five boxes and a mini fridge"* → *"about \$133"* in one sentence.
- **Protects the busy days** — steers callers to open days so the two peak days that carry **74% of revenue** stop overflowing.
- **Backend fixed** — invoice/item data that was showing empty now loads (654 records); wrong-person matches tightened.

Just built (one deploy from live)

- **One dashboard, six tools** — a single link opens chat, voice, estimate, ask-your-data, business insights and a staff ops center, in a polished branded interface that works on any phone.
- **Self-serve estimate page** — a customer photographs their pile *and/or* types what they have and gets a price on the spot. Understands typos, word-quantities and **any item** — things not on the price list are AI-matched to the closest priced item, shown transparently (*"1× Skateboard — you said 'baseball bat'"*). Free AI vision, no subscription.
- **Web chat + browser voice** — the live phone agent's exact brain, testable by text or voice for **free** (no call minutes), with the same identity-verified order lookup.
- **Business insights + ask-your-data** — a live dashboard of revenue/demand/data-quality, and a plain-English analyst that answers questions like *"how much should I*

raise prices?" with concrete numbers.

- **Ops command center + demand forecast** — staff pick a day and get balanced crew routes with **sequenced, printable run sheets**, plus a next-season forecast that now projects the peak week, the crews it needs (the live peak day runs **334 pickups**), and the **revenue** in that window. A one-screen **staff console** rolls up today's route, billing to recover, forecast, and data health. Repeat customers with multiple orders are handled cleanly on the phone.
- **Sells on every quote + protects on every move** — each quote now suggests the add-ons students actually store together ("*most people also add a Plastic Container or Mini Fridge*"), and a **photo condition check** reads good/wear/damage for move-out dispute protection and a protection-plan upsell. The order lookup can also recognize a returning **caller by their phone number**.
- **Built to stay up** — a caching layer keeps quotes and lookups working through a transient Google Sheets outage, and a **40-test automated suite runs on every code change** so nothing quietly breaks.

The numbers that matter

\$87,782	invoiced in a 13-day move-out sprint — 74% in 5 days
65%	of revenue from one product (the UTrucking Box), on 96.9% of orders
86%	of orders completed · ~ \$1,056 billing leakage found · 212 orders left un-dispatched

Highest-impact moves (ranked)

1. **Raise the box \$2 → +\$5,186/year (+5.9%)**. One number, near-zero risk.
2. **Smooth the peak**. The assistant fills the slow days so the busy days stop dropping orders — protects the 74%.
3. **Photo-to-quote — now built**. Customers photograph their pile; AI quotes instantly. Our item photos make this a moat no competitor has.

What's next

Turn the assistant from *answering* to *doing*: **book pickups on the call, text reminders & confirmations, auto-generate invoices**, and **run the fall return-season outreach** by text. All of it rides on the system already built — the crew-routing and forecast pieces are done.

Bottom line: front-desk deflection is live, and the assistant already quotes *and upsells* on every estimate. The next build adds the last receptionist move — **booking the pickup on the call** — at a fraction of the cost of a hire.
